Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 1; Page 39; 58pp; English.

pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein

                    셤
                                                                                                                            The patent describes a new preparation of microparticles each comprising a polymeric matrix and a nucleic acid. The polymeric matrix consists of one or more synthetic polymers having a solubility in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid); and at least 90% of the microparticles have a diameter of less than 100 microns. The microparticles are useful for the delivery of nucleic acids to phagocytic cells. In one embodiment the microparticles are less than 20 microns in diameter and the nucleic acid (preferably in closed circular form) includes an expression control sequence operatively linked to a coding sequence, where the expression product of the coding sequence is a polypeptide having a length and a sequence which permits it to bind to an MHC class I or II molecule. The expression product is thus an effective cimulator of an immune response in mammals. The present sequence, an antigenic portion of desmoglein 3, is an example of an MHC class II
                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Microparticle encapsulated nucleic acids - for recombinant expression of proteins e.g. in gene therapy.
3 protein (amino acids 190-204) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in AAW04841-47

microparticle preparation (WP) has been developed, consisting of
microparticles having a diameter of less than 100 mu m. The MP comprises:

(a) a polymeric matrix (PM) consisting of one or more synthetic polymers
consisting a solubility in water of less that 1 mg/1; and (b) an expression
consisting a solubility in water of less that 1 mg/1; and (b) an expression
consisting a solubility in water of less that 1 mg/1; and (b) an expression
conficulation of a consisting of consisting an expression control sequence operatively
consisted to a coding sequence, where the coding sequence operatively
consisting product selected from: (1) a polypeptide at least 7 amino
consisting product selected from: (1) a polypeptide at least 7 amino
consisted to a coding sequence identical to the sequence of: (i) a
consisting product selection from an infectious agent which infects a
consisting procuring mammalian protein; or (ii) a fragment
consisting a naturally-occurring mammalian protein;
consisting a length and sequence which permits it to
bind to an MHC class I or II molecule; and (3) the polypeptide or the
consisting sequence. AAM69765, and
consisting an entity effective vehicles for the delivery of
consisting sene highly effective vehicles for the delivery of
colymiclocides into phagocytic cells. They can be used for gene therapy,
consisting an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                       New preparations of microparticles - comprising a synthetic polymer matrix and nucleic acid comprising an expression vector for use in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 71; DB 2; Length 15; 100.0%; Pred. Continuous production of microparticles containing nucleic acid for e.g. gene therapy, comprises mixing a solution of polymeric material and nucleic acid with a surfactant solution, removing solvent and drying.
          Continuous flow production; microparticle; gene therapy; antisense therapy; vaccination; treatment; autoimmune disease; immune response modulation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to microparticles which are less than 20 microns in diameter, which comprise a polymeric matrix, a lipid and a nucleic acid molecule. The microparticle is specifically not encapsulated in a liposome and does not comprise a cell. The nucleotide sequence encodes an expression product that binds to major histocompatibility complex (WHC) type I or II molecules. Peptides AAB33602-B33647 represent WHC class II associated immunogenic peptides, and AAB33648-B33710 represent MHC class I associated immunogenic peptides. The peptides are examples of the expression products of the nucleotide sequences which can be included in the microparticles of the invention. Sequences AAB33711-B33716 represent alternative expression products and nuclear localisation signals also used in the invention. The microparticles are useful for administering a nucleic acid into the mucosal tissue preferably vaginal
                                                                                                                                             Microparticle, nucleic acid delivery, immunogenic peptide, MHC 1; MHC 11, major histocompatibility complex; vaginal tissue, mucosal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                 Microparticles useful for administering a nucleic acid into the mucosal tissue preferably vaginal tissue of an animal, comprises a polymeric matrix, a lipid and a nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The present sequence is that of a peptide of the invention. The invention relates to a method for scalable, continuous flow production of a nucleic acid containing microparticle that maintains the structural integrity of the associated nucleic acid and results in a microparticle having purity suitable for introduction into an animal host. Microparticle prepared according to the method can be used for delivery of a nucleic acid for gene therapy, antisense therapy, accination, treatment of autoimmune disease and either specific or non-specific modulation of an immune response. The microparticles may also be used to deliver nucleic acid encoding a protein or peptide useful in any kind of therapy. The method is economical, aseptic and scalable. The method also enables control over the size of microparticles. The microparticles graded are free of impurities such as organic solvents and are readily dispersed in a wide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alpha-MSH; inflammation; autoimmune disease; gene therapy; sepsis; alpha-melanocyte stimulating hormone; rheumatoid arthritis; asthma; cirrhosis; dermatitis; psoriasis; inflammatory bowel disease; immunosuppressive; antiinflammatory; antirheumatic; antiarthritic; antiasthmatic; antibacterial; dermatological; antipsoriatic; antidabetic; ophthalmological; neuroprotective; multiple sclerosis; diabetes; uveitis; coeliac disease.

The invention relates to a microparticle (microsphere) less than 20 microns in diameter that comprises: (1) a polymeric matrix; (2) a lipid; and (3) a nucleic acid molecule. The microparticle is not encapsulated in a liposome and the microparticle so not comprise a cell. The microparticles are used as vehicles for the delivery of polymicleotides into phagocytic cells. The microparticles can be used to express antigens to treat tumour cells or viral, bacterial, fungal or protozoan infections. The microparticles can be made without adversely affecting nucleic acid integrity. The present sequence represents the amino acid sequence of a major histocompatability complex, WHC, class II associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Notch signalling; modulator; antigen; antigenic determinant; immune disorder; immune disorder; immune tolerance; peripheral T-cell activation; regulatory T-cell; T reg; tumour; cancer; autoimmune disorder; allergy; transplant rejection; immunosuppressive; cytostatic; antiallergic; vaccine; human; autoantigen; desmoglein 3; DSG3; pemphigus; MHC class II peptide; major histocompatibility complex;
                                                                                                                                                    Microparticles, useful as vehicles for delivery of polynucleotides to phagocytic cells, comprises polymeric matrix, lipid, and nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human desmoglein 3 (DSG3) antigenic determinant (residues 190-204).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 71; DB 6; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataent. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatory arthitis, asthma, sepsis, cirrhosis, dermattiis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uvestis and coeliac disease. The present sequence is a peptide described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a product comprising (1) a pharmaceutical support matrix for in vivo administration bearing modulators of Notch signalling (especially a Delta or Serrate/Jagged protein or fragment or homologue thereof); and (2) an antigen or antigenic determinant. The product polynucleotide encoding an antigen or antigenic determinant. The product acts as a combined preparation for modulation of the immune system or for modulation of an immune response to the antigen or antigenic determinant. The invention also relates to a pharmaceutical composition comprising the product; a particle with a maximum linear dimension of less than 500 (preferably 30-70) nm having several bound modulators of Notch signalling; a method of modulating Notch signalling; methods of treating an immune disorder, for reducing an immune response, for promoting immune tolerance or pathogen antigen or its antigenic determinant in a mammal; and a method for increasing an immune response to a untigen or antigenic determinant, for promoting an immune response to an antigen or antigenic determinant, for promoting immune tolerance to an antigen or antigenic determinant, or for treating tumours, autoimmune disease, allegase of an antigenic determinant tespons. The presents sequence represents an antigenic determinant derived from a human control means.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                              New product for modulating the immune system, comprises a pharmaceutical support matrix bearing modulators of Notch signaling, and an antigen or antigenic determinant, or a polynucleotide coding for the antigen or

Desmoglein 3 (DSG3) (aa 190-204), class II MHC associated autoantigen

ઠે

DSG3; Desmoglein 3; autoantigen; notch signalling pathway; autofumune disorder; bystander effect; suppression; DSL domain; BGF domain; Goodpasture's disease; Wegener's granulomatosis; anaemia; thrombocytopenia; gastritis; hepatitis; vasculitis; scleroderma; myositis; arthritis; Systemic Lupus Erythematosus; SLE; Systemic Lupus Erythematosus; SLE; Systemic Sibroderma; dermatitis; placental dysfunction; eclampsia;

```
The invention relates to the modulation of immune function through a notch signalling pathway for the prevention of autoimmune diseases. It can be as been found that the notch signalling pathway provides a bystender effect or bystander suppression effect, which can be used in a wide variety of ways to suppress unwanted immune responses in immune diseases and disorders. Autoimmune diseases are characterised by immune responses that are directed against self antigens. T lymphocytes are activated upon recognition of a self antigen and/or a foreign antigen as complex (MEC) gene products on the surface of antigen presenting cells (APC). The invention provides the method of modulating of an immune response. The modulator of antigen pathway is an agent which activates the notch pharmaceutical kit for suppression of an immune response. The modulator of the notch signalling pathway is an agent which activates the notch of the notch signalling pathway is an agent which activates the notch is a polynucleotide which codes for such an agent. It comprises a protein or polypeptide comprising a notch ligand DSL (delta serrate lagand N terminal domain, and optionally one or more heterologus amino acid or a polynucleotide sequences. The modulator can be a fusion protein comprising a segment of a notch ligand extracellular domain and an immunoglobulin Fc segment. The disorders include Goodpasture's disease, wegener's granulomatosis, autoimmune ansemia, thrombocytopenia, comprising a segment of a notch ligand extracellular domain and commune ansemia, thrombocytopenia, comprising a segment. The disorders include Goodpasture's disease, wasculitis, seleroderma, myositis, autoimmune arthritis, Seleroderma, wyositis, autoimmune arthritis, Seleroderma, wyositis, autoimmune arthritis, seleroderma, wyositis, autoimmune arthritis, seleroderma, cinflammatory related gynaecological disease, huntington disease, cinflammatory related gynaecological diseases, neurodegenerative disease, encephalitis, encephalitic disease, paracteric disease, met
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New product having a modulator of the Notch signaling pathway, useful for modulating an immune response in autoimmune disorders, such as anemia, gastritis, hepatitis, scleroderma and myositis.
               Alzheimer's disease; Parkinson's disease; Huntington disease; encephalitis; psychiatric disorder; Down's syndrome; stroke; exogenous; bysteander antigen; multiple sclerosis; delta serrate lag; inflammatory bowel disease; notch receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 66; 244pp; English.

sclerosis, etc. The invention discloses a method for generating immune suppression at a disease locus by administering an exogenous antigen. It also provides the use of modulator or activator of notch signalling in simultaneous, separate or sequential combination with a bystander antigen or antigenic determinant for reducing an immune response to a target antigen. The presented protein sequence is the desmoglein 3 (DSG3) (aa 190-204), class II MHC associated autoantigen.
                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a particle (I) capable of being inserted into or taken up by a cell comprising (i) a polynucleotide coding for a modulator of Notch signaling, and (ii) a polynucleotide coding for an antigen or antigenic determinant. The first polynucleotide sequence codes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Particle capable of being inserted into or taken up by cell useful for modulating immune response to antigen in subject, comprises polynucleotide coding for modulator of Notch signaling, and polynucleotide coding for antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antiarthritic; Antirheumatic; Antiallergic; Vaccine; Notch signaling; Notch, Notch ligand; Delta protein; Serrate protein; Jagged protein; multiple sclerosis; rheumatoid arthritis; diabetes; allergy; immune discase; graft rejection; cancer;

for a Notch ligand such as a Delta or Serrate/Jagged protein or its fragment, derivative, homologue, analogue or allelic variant, or for a protein which comprises a Notch ligand box domain and at least one Notch ligand EGP-like domain and optionally a membrane binding or transmembrane close domain. The first and second sequences are operably linked to one or more promoters or enhancers or polyadenylation sequences. The antigen or antigenic determinant is an allergen, autocantigen, Major Histocompatibility complex (MHC) (transplant) antigen, pathogen antigen, cumour antigen or their antigenic determinant. (1) is useful for modulating an immune response to an antigen in a subject. Pharmaceutical compositions mediated by T cells, such as multiple sclerosis, rheumatoid arthritis, diabetes, allergy, for treating immune diseases of graft rejection such as allograft rejection, treating immune diseases of graft rejection such as allograft rejection, treating cancer and organ transplants. The present sequence is a desmoglein 3 antigenic peptide (a class II MHC-associated autoantigen peptide), which can be used as an antigen to prepare the particle of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sulforransferase 19 protein (I). The present invention also describes a method of applying (I) in the treatment of various diseases, such as haemorrhagic diseases, thrombus embolism, other haemopathy, myocardial infarction, various tumours, inflammation, immunological diseases and HIV infection. The present invention also describes the agonist resisting (I) and its treatment effect. The present sequence represents the N-terminal peptide of (I) which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; heparan sulfate 3-O-sulfotransferase 19; haemorrhagic disease; thrombus embolism; haemopathy; myocardial infarction; tumour; inflammation; immunological disease; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human heparan sulfate 3-0-sulfotransferase 19 peptide SEQ ID NO:7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide-heparan sulfate 3-0-sulfotransferase 19 and polynucleotide for coding such polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes human heparan sulfate 3-0-

CC The invention relates to a new isolated polypeptide (designated NOVX)

COMPITISING one of 141 fully defined sequences, their mature forms, a

CC protein compitaing one or more conservative substitutions or having at

C least 95% identity to one of the 141 proteins. Also included are a

CC composition comprising NOVX (or a NOVX nucleic acid molecule (NA)), a kit

CC official compitaing NOVX (or a NOVX nucleic acid molecule (NA)), a kit

CC comprising the composition of NOVX in more containers, an isolated

CC culturing a cell under conditions that lead to expression of the

CC polypeptide, where the cell comprises a vector comprising NOVX (comprising

CC polypeptide, where the cell comprises a vector comprising NOVX NA),

C identifying an agent that binds to NOVX, identifying a potential

CC therapeutic agent for use in the treatment of a pathology that is related

CC to abstract expression or physiological interactions of NOVX, screening

CC to a modulator of activity of or latency or predisposition to a

C pathology associated with NOVX, modulating the activity of NOVX, treating

CC or preventing a pathology associated with NOVX, mucleic acid molecule, a

CC all comprising the vector, an antibody that immunospecifically binds to

NOVX, determining the presence or amount of NOVX or the nucleic acid molecule in a sample, and determining the presence of or predisposition

CC molecule in a sample, and determining the presence of or predisposition

CC molecule in a sample, and determining the presence of or predisposition

CC molecule in a sample, and determining the presence of or predisposition

CC molecule in a sample, and a first mammalian subject. The methods and

CC compositions of the present interval.

CC compositions of the present are useful for the diagnosis and

CC compositions of the present and a subject. The methods and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     treatment of disorders associated with aberrant expression or activity of the NOVX polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. ```
to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.
```

Example 1; Page 31; 73pp; English.

The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPs). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.

Isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.

Example 1; Page 31; 73pp; English.

The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPs). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a WHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection. The T

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAWB5284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate cancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, lyme disease, hepatitis, post-streptococcal endocarditis, glomerulonephritis and food hypersensitivity
   for
cells, a T cell clone or a T cell population or preparation is useful identifying hetercolltic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 15
B27696
contraction-inhibiting peptide II - blue mussel
C;Species: Mytilus edulis (blue mussel)
C;Becession: B27696
C;Accession: B27696

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 1; Page 40; 58pp; English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autorimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein X8XEXEXEXEXEXEXEXEXEXEXEXEX

The polymeric matrix consists of one or more synthetic polymers having a solubility in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid); and at least 90% of the microparticles have a diameter of less than 100 microns. The microparticles are useful for the delivery of nucleic acids to phagocytic calls. In one embodiment the microparticles are less than 20 microns in diameter and the nucleic acid (preferably in closed circular form) includes an expression control sequence operatively linked to a coding collopeptide having a length and a sequence which permits it to bind to an MHC class I or II molecule. The expression product is thus an effective etimulator of an immune response in mammals. The present sequence, an antigenic portion of desmoglein 3, is an example of an MHC class II
                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Microparticle encapsulated nucleic acids - for recombinant expression of
3 protein (amino acids 206-220) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in AAW04841-47
                                                                                                                                                                                                                                       Gaps

microparticle preparation (WP) has been developed, consisting of
microparticles having a diameter of less than 100 mu m. The MP comprises:

(a) a polymeric matrix (PM) consisting of one or more synthetic polymers
baving a solubility in water of less that 1 mg/1; and (b) an expression
circles) or circular plasmid DNA (at least 50% of which are closed
circles) or circular plasmid DNA (at least 50% of which are closed
circles) or circular plasmid DNA (at least 50% of which are closed
circles) or circular plasmid DNA (at least 50% of which are closed
circles) or circular plasmid DNA (at least 50% of which are closed
circles) or circular plasmid on the control sequence operatively
a PM; and (b) a NAM comprising an expression control sequence operatively
control selected from: (1) a polypeptide at least 7 amino
expression product selected from: (1) a polypeptide at least 7 amino
cacids in length, having a sequence identical to the sequence of: (i) a
fragment of a naturally-occurring mammalian protein; or (ii) a fragment
of a naturally-occurring protein from an infectious agent which infects
condition of the naturally a length and sequence which permits it to
bind to an MHC class I or II molecule; and (3) the polypeptide or the
peptide linked to a trafficking sequence. AMM53763 to AAM98956, and
cham's 10 AAW78997 are peptide fragments for use in the present
invention. The MPs are highly effective vehicles for the delivery of
colymuclectides into phagocytic cells. They can be used for gene therapy,
c e.g. for treating genetic diseases, infections or tumours or for
                                                                                                                                                                                                                                                                         Microparticle; delivery; polymeric matrix; autoantigen; tumour antigen; class II associated peptide; pathogen; gene therapy; genetic disease; infection; downregulation; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New preparations of microparticles - comprising a synthetic polymer matrix and nucleic acid comprising an expression vector for use in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Continuous production of microparticles containing nucleic acid for e.g. gene therapy, comprises mixing a solution of polymeric material and nucleic acid with a surfactant solution, removing solvent and drying.
         Continuous flow production; microparticle; gene therapy; antisense therapy; vaccination; treatment; autoimmune disease; immune response modulation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to microparticles which are less than 20 microns in diameter, which comprise a polymeric matrix, a lipid and a nucleic acid molecule. The microparticle is specifically not encapsulated in a liposome and does not comprise a cell. The nucleotide sequence encodes an expression product that binds to major histocompatibility complex (MHC) type I or II molecules. Peptides AAB33602-B3364 represent MHC class I associated immunogenic peptides, and AAB33648-B33710 represent MHC class I associated immunogenic peptides. The peptides are examples of the expression products of the nucleotide sequences which can be included in the microparticles of the invention. Sequences AAB33711-B33716 represent alternative expression products and nuclear localisation signals also used in the invention. The microparticles are useful for administering a nucleic acid into the mucosal tissue preferably vaginal
                                                                                                                                             Microparticle, nucleic acid delivery; immunogenic peptide, MHC 1; MHC 11; major histocompatibility complex; vaginal tissue; mucosal tissue.
                                                                                                                                                                                                                                                                                                                                                                                              Microparticles useful for administering a nucleic acid into the mucosal tissue preferably vaginal tissue of an animal, comprises a polymeric matrix, a lipid and a nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
relates to a method for scalable, continuous flow production of a nucleic acid containing microparticle that maintains the structural integrity of the associated nucleic acid and results in a microparticle having purity suitable for introduction into an animal host. Microparticle prepared according to the method can be used for delivery of a nucleic acid for agene therapy, antisense therapy, vaccination, treatment of autoimmune disease and either specific or non-specific modulation of an immune response. The microparticles or non-specific modulation of an immune encoding a protein or peptide useful in any kind of therapy. The method is economical, aspetic and scalable. The method also enables control over the size of microparticles. The microparticles are discreparticles are free of impurities such as organic solvents and are readily dispersed in a wide
                                                                               present sequence is that of a peptide of the invention. The invention

The invention relates to a microparticle (microsphere) less than 20 microns in diameter that comprises: (1) a polymeric matrix; (2) a lipid; and (3) a nucleic acid molecule. The microparticle is not encapsulated in a liposome and the microparticle does not comprise a cell. The microparticles are used as vehicles for the delivery of polynucleotides into phagocytic cells. The microparticles can be used to express antigens to treat tumour cells or viral, bacterial, fungal or protozoan infections. The microparticles can be made without adversely affecting nucleic acid integrity. The present sequence represents the amino acid sequence of a major histocompatability complex, MHC, class II associated peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Notch signalling, modulator; antigen; antigenic determinant; immunomodulator; immune disorder; immune response; immune tolerance; peripheral T-cell activation; regulatory T-cell; T reg; tumour; cancer; autoimmune disorder; allergy; transplant rejection; immunosuppressive; cytostatic; antiallergic; vaccine; human; autoantigen; desmoglein 3; DSG3; pemphigus; MHC class II peptide; major histocompatibility complex; antigenic determinant; epitope.
                                                                                                                                               Microparticles, useful as vehicles for delivery of polynucleotides to phagocytic cells, comprises polymeric matrix, lipid, and nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human desmoglein 3 (DSG3) antigenic determinant (residues 206-220).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 76; DB 6; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataent. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatoid arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The present sequence is a peptide described in the exemplification of the

The invention relates to a product comprising (1) a pharmaceutical support matrix for in vivo administration bearing modulators of Notch support matrix for in vivo administration bearing modulators of Notch signalling (especially a Delta or Serrate/Jagged protein or fragment or homologue thereof); and (2) an antigen or antigenic determinant, or polynucleotide encoding an antigen or antigenic determinant. The product cats as a combined preparation for modulation of the immune system or for modulation of an immune response to a pharmaceutical composition comprising the invention also relates to a pharmaceutical composition comprising the product; a particle with a maximum linear dimension of less than 500 (preferably 30-70) nm having several bound modulators of Notch signalling; a method of modulating nethods of treating an immune composition and method for increasing an immune response to a tumour or pathogen antigen or its antigenic determinant in a mammal. The composition and methods are useful for modulating peripheral T-cell activation, for generating regulatory T-cells (T regs), for reducing an immune response to an antigen or antigenic determinant, or for promoting cummune relevance to an antigen or antigenic determinant, or for treating tumours, autoimmune disease, allergies or transplant rejection. The present sequence represente an antigenic determinant derived from a human corresponse to an antigen or antigenic determinant derived from a human corresponse to an antigen or antigenic determinant derived from a human corresponse to an antigen or antigenic determinant derived from a human corresponse to an antigen or antigenic determinant or for treating automantigen which may be used in a product of the invention.
                                                                                                                                                                                                                                                                                                                                                  New product for modulating the immune system, comprises a pharmaceutical support matrix bearing modulators of Notch signaling, and an antigen or antigenic determinant, or a polynucleotide coding for the antigen or

The invention relates to the modulation of immune function through a notch signalling pathway for the prevention of autoimmune diseases. It control signalling pathway provides a byetander of thas been found that the notch signalling pathway provides a byetander effect or bystander suppression effect, which can be used in a wide variety of ways to suppress unwanted immune responses in immune responses conditions. Autoimmune diseases are characterised by immune responses conditions of a self antigen and/or a foreign antigen as a complex with self major histocompatibility complex (MHC) gene products on the surface of antigen presenting cells (APC). The invention provides the method of modulating of an immune response, modulator information and a pharmaceutical kit for suppression of an immune response. The modulator of the notch signalling pathway is an agent which activates the notch receptor or a polymucleotide which codes for such an agent. It comprises to protein or polypeptide comprising a notch ligand bactivates the notch ligand somain, notch ligand some or more heterologous amino acid or a polymucleotide sequences. The modulator can be a fusion protein comprising a segment of a notch ligand extracellular domain, and optionally one or more heterologous amino comprising a segment of a notch ligand extracellular domain, and optionally one or more heterologous amino comprising a segment. The disorders include Goodpasture's disease, Wegener's granulomatosis, autoimmune ansemia, thrombocytopenia, comprising a segment. The disorders include Goodpasture's disease, wascultis, scleroderma, myositis, autoimmune arthritis, scleroderma, myositis, autoimmune arthritis, scleroderma, gostitis, autoimmune arthritis, scleroderma, gostitis, autoimmune arthritis, scleroderma, myositis, autoimmune arthritis, scleroderma, myositis, autoimmune arthritis, scleroderma, myositis, autoimmune arthritis, scleroderma, myositis, autoimmune arthritis, scleroderma, disease, partine disease, huntington disease, inflammatory related gynaecol New product having a modulator of the Notch signaling pathway, useful for modulating an immune response in autoimmune disorders, such as anemia, gastritis, hepatitis, scleroderma and myositis. sclerosis, etc. The invention discloses a method for generating immune suppression at a disease locus by administering an exogenous antigen. It also provides the use of modulator or activator of notch signalling in simultaneous, separate or sequential combination with a bystander antigen or antigenic determinant for reducing an immune response to a target antigen. The presented protein sequence is the desmoglein 3 (DSG3) (as 206-220), class II MHC associated autoantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a particle (I) capable of being inserted into or taken up by a cell comprising (i) a polymucleotide coding for a modulator of Notch signaling, and (ii) a polymucleotide coding for an antigen or antigenic determinant. The first polymucleotide sequence codes

for a Notch ligand such as a Delta or Serrate/Jagged protein or its fragment, derivative, homologue, analogue or allelic variant, or for a protein which comprises a Notch ligand DSL domain and at least one Notch ligand BGP-like domain and optionally a membrane binding or transmembrane commain. The first and second sequences are operably linked to one or more promoters or enhancers or polyadenylation sequences. The antigen or more promoters or enhancers or polyadenylation sequences. The antigen or more promoters or enhancers or polyadenylation sequences. The antigen or more more more more that compatibility complex (MHC) (transplant) antigen, pathogen antigen, tumour antigen or their antigenic determinant. (1) is useful for modulating an immune response to an antigen in a subject. Pharmaceutical compositions mediated by T cells, such as multiple sclerosis, rheumatoid arthritis, diabetes, allergy, for treating immune diseases of graft rejection such as allograft rejection, treating immune diseases of graft rejection such as allograft rejection, treating immune diseases of graft rejection such as allograft rejection, treating immune diseases of graft rejection such as allograft rejection, treating immune diseases of graft rejection such as allograft rejection, treating ancer and organ transplants. The present sequence is a desmoglein 3 antigenic peptide (a class II MHC-associated autoantigen peptide), which can be used as an antigen to prepare the particle of the

cadherin

```
The present invention describes cadherin modulating agents (MA)

comprising peptides which comprise a nonclassical cadherin cell adhesion

recognition (CAR) sequence. The MAs can be used for modulating

crecognition (CAR) sequence. The MAs can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a

mammal, enhancing delivery of a drug through the skin of a mammal,

chancing delivery of a drug to a tumour in a mammal, treating cancer in

a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting

cangiogenesis in a mammal inducing apoptosis in a nonclassical cadherin-

expressing cell, preventing or treating obesity in a mammal, stimulating

blood vessel regression in a mammal, enhancing drug delivery to the

contral nervous system, treating a demyelinating neurological disease,

increasing vasopermeability in a mammal. Heay can also be used for

conclassical cadherin-expressing cells, inhibiting synaptic stability in

a mammal, or preventing pregnancy in a mammal. They can also be used for

e.g. enhancing or directing neurite outgrowth, facilitating wound healing

or reducing scar tissue, or enhancing adhesion of foreign tissue in a

mammal. They can also be used for treating e.g. psoriasis, arthritis, age

crelated macular degeneration, multiple sclerosis and diabetes. The

products can also be used for detection and diagnosis and in bioreactors.

AAV66532 to AAV64512 represent specifically claimed peptides, and

AAV66531 to AAV64512 represent sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Desmosomal cadherin, cell adhesion, CAR sequence, immunosuppressive, cytostatic, antiapoptotic, wound healing, reduce scar tissue, skin graft, organ implant, autoimmune blistering disorder, cancer, apoptosis, cyclic.
                 New cadherin modulating agents, used for modulating nonclassical ca-
mediated functions for treating e.g. cancers, obesity, rheumatoid
arthritis, multiple sclerosis, diabetes or a neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Modulating agents for inhibiting or enhancing desmosomal cadherin

ö

Gaps

```
The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, comprising a modulating agent comprising a desmosomal cadherin cell adhesion recognition CAR sequence (ABB45341-ABB47262), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polymorleotide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence or analogue. The modulating agents have immunosuppressive, cytostatic and antiapoptotic activity and are used to facilitate wound healing and/or reduce scar tissue, for enhancing adhesion of foreign tissue implants (e.g. skin graft or organ implant), treating an autoimmune blistering disorder and to treat cancer (e.g. carcinoma, leukaemia or melanoma) and induce apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modulation; nonclassical cadherin mediated cell adhesion; CAR; inhibition; cadherin extracellular domain; cell adhesion recognition; OB-cadherin; cadherin-15; cadherin-1; cadherin-19; cadherin-14; cadherin-15; T-cadherin; Cadherin; cadherin related neuronal receptor; LI-cadherin; protocadherin; cadherin related murch a semical midensi democallin; calcium binding; cancer; tumour; obesity; rhemmatoid arthritis; multiple sclerosis; diabetes; metastasis; neurological disease; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "the terminal residues are condensed with each other to form a cyclic peptide"
mediated cell adhesion, useful for facilitating wound healing and/or reducing scar tissue, treating cancer and inducing apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes cadherin modulating agents (MA)

Comprising peptides which comprise a nonclassical cadherin cell adhesion

ceconition (CAR) sequence. The MAs can be used for modulating

crecognition (CAR) sequence. The MAs can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a

mammal, enhancing delivery of a drug through the skin of a mammal,

chancing delivery of a drug to a tumour in a mammal, treating cancer in

a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting

concressing cell, preventing or treating obesity in a mammal, simbiting

concressing vesperssion in a mammal, enhancing drug delivery to the

contral nervous system, treating a demyelinating neurological disease,

increasing vasopermeability in a mammal, enhancing adhesion of

concressing vasopermeability in a mammal. They can also be used for

a mammal, or preventing pregnancy in a mammal. They can also be used for

cor reducing scar tissue, or enhancing adhesion of foreign tissue in a

mammal. They can also be used for treating e.g. psoriasis, arthritis, age

cor reducing scar tissue, or enhancing adhesion of foreign tissue in a

mammal. They can also be used for treating e.g. psoriasis, arthritis, age

cor reducing scar tissue, or enhancing adhesion of foreign tissue in a

mammal. They can also be used for detection and diagnosis and in bioreactors.

AAV66532 to AAX64572 represent specifically claimed peptides, and

cor reducing examples of the content of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the core of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                  New cadherin modulating agents, used for modulating nonclassical cadherin -mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Desmosomal cadherin; cell adhesion; CAR sequence; immunosuppressive; cytostatic; antiapoptotic; wound healing; reduce scar tissue; skin graft; organ implant; autoimmune blistering disorder; cancer; apoptosis; cyclic.

                                                                            The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, comprising a modulating agent comprising a desmosomal cadherin cell adhesion recognition CAR sequence (ABB45341-ABB47262), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polymucleotide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence or anioque. The modulating agents have immunosuppressive, cytostatic and antiapoptotic activity and are used to facilitate wound healing and/or reduce scar tissue, for enhancing adhesion of foreign tissue implants (e.g. skin graft or organ implant), treating an autoimmune blistering disorder and to treat cancer (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modulation; nonclassical cadherin mediated cell adhesion; CAR; inhibition; cadherin extracellular domain; cell adhesion recognition; OB-cadherin; cadherin-5; cadherin-7; cadherin-12; cadherin-14; cadherin-15; T-cadherin; PB-cadherin; cadherin-15; T-cadherin; Cadherin; cadherin; cadherin; protocadherin; cadherin; cadherin; protocadherin; cadherin; desmoglelin; desmocollin; calcium binding; cancer; tumour; obesity; rheumatoid arthritis; multiple sclerosis; diabetes; metastasis; neurological disease; cyclic.

```
New cadherin modulating agents, used for modulating nonclassical cadherin -mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurological disease.
```

Claim 90; Page 209; 252pp; English.

The present invention describes cadherin modulating agents (MA)

comprising peptides which comprise a nonclassical cadherin cell adhesion

cecognition (CAR) sequence. The MAS can be used for modulating

crecognition (CAR) sequence. The MAS can be used for edition

crecognition (CAR) sequence. The MAS can be used for edition

conclassical cadherin-mediated functions. They can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug to a tumour in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting cancer in a mammal, inhibiting angiogenesis in a mammal, inducing apoptosis in a mammal, inhibiting call, preventing operating obesity in a mammal, istimulating contral nervous system, treating a demyelinating neurological disease, increasing vacopermeability in a mammal, enhancing adhesion of conclassical cadherin-expressing cells, inhibiting symaptic stability in a mammal, or preventing pregnancy in a mammal. They can also be used for treating e.g. psoriasis, arthritis, age correlated macular degeneration, multiple sclerosis and diabetes. The products can also be used for treating e.g. psoriasis, arthritis, age related macular degeneration, multiple sclerosis and diabetes, and ANY64572 represent sequences used in the exemplification of the present invention

"Composition and role of tapetal lipid bodies in the biogenesis of the pollen coat of Brassica napus.";
Planta 208:588-598(1999).
-!- FUNCTION: May play a structural role in the elaioplast, a tapetum-specific plastidial lipid organelle:
-!- TISSUE SPECIFICITY: Tapetum of anthers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15-JUL-1999 (Rel. 38, Created)

Graumann P., Schroeder K., Schmid R., Marahiel M.A.;

"Cold shock stress-induced proteins in Bacillus subtilis.";

J. Bacteriol. 178:4611-4619(1996).

-!- SINDELLULAR LOCATION: Cytoplasmic.

-!- INDUCTION: In response to low temperature.

-!- CAUTION: Could not be found in the genome of B.subtilis 168.

Direct protein sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacteria; Proteobacteria; Alphaproteobacteria; Caulobacterales;
